

PROVO CITY CORPORATION
DEVELOPMENT SERVICES DEPARTMENT
Planning Commission Agenda
February 11, 2026

NOTICE OF PUBLIC HEARING BEFORE THE PLANNING COMMISSION

The Provo City Planning Commission will hold a public hearing on February 11, 2026 at 6:00 PM. Located at: Council Chambers 445 West Center Street. The items listed below will be discussed, and anyone interested is invited to participate and provide comment. Hearings can be viewed live and on-demand at: YouTube [youtube.com/user/ProvoChannel17](https://www.youtube.com/user/ProvoChannel17) and on Facebook [facebook.com/provochannel17](https://www.facebook.com/provochannel17).

NOTICE OF PUBLIC MEETING BEFORE PROVO MUNICIPAL COUNCIL

On Tuesday, **March 10, 2026**, at 5:30 PM. the Provo Municipal Council will consider the items noted below with a star (*). Items noted on the agendas with a star require legislative action by the Municipal Council. Council agendas can be viewed at the Provo City Council web site on the Thursday prior to the Council meeting at <http://agendas.provo.gov>. For more information, call (801) 852-6120.

Unmarked items are administrative and require the approval only of the Planning Commission. Decisions on the unmarked items may be appealed to the Board of Adjustment by making application by 6:00 PM. **within 14 days of the Planning Commission decision.**

Study Session

1. Multi-family Design Standards – Bill Peperone and Aaron Ardmore

Public Hearings

- *Item 1 Stephen Styler requests a Zone Map Amendment to add the Data Center Overlay (DC) Zone to property in the PIC Zone, to develop a data center located at 1507 S 180 E. East Bay Neighborhood. Dustin Wright (801) 852-6414 dwright@provo.gov PLRZ20250622
- Item 2 Reid Wintersteen requests Project Plan approval for a new 66,000 square foot data center in the PIC (Planned Industrial Commercial) Zone, located at 1507 South 180 East. East Bay Neighborhood. Dustin Wright (801) 852-6414 dwright@provo.gov PLPPA20250210

Preceding the public hearing, there will be a Study Session at 5:00 PM. at the Provo Peak Conference Room, 445 W Center Street. The Study Session is open to the public; however, formal presentation of items, public comment and actions will be reserved for the public hearing at 6:00 PM.

To send public comments to Planning Commission members, email them at dspublichearings@provo.gov. Please submit public comment emails before 3:00 PM the day of the hearing. Additional information can be found at provo.gov/publiccomments.

Copies of the agenda materials, public hearing procedure, and staff recommendations are available the week of the hearing at a reasonable cost at 445 W Center Street, Suite 200, Provo between the hours of 7:00 AM. and 6:00 PM., Monday through Thursday. Agendas and staff recommendations are also generally available on the Provo City Development Services web site the week of the meeting at provo.gov/planningcommission.

Provo City will make reasonable accommodations for all citizens interested in participating in this meeting. If assistance is needed to allow participation at this meeting, please call the Development Services Department at (801) 852-6400 before 12:00 PM. the day before the meeting to make arrangements.

By order of the Provo City Planning Commission
Planning Secretary, (801) 852-6424

- *ITEM 1** Stephen Styler requests a Zone Map Amendment to add the Data Center Overlay (DC) Zone to property in the PIC Zone, to develop a data center located at 1507 S 180 E. East Bay Neighborhood. Dustin Wright (801) 852-6414 dwright@provo.gov PLRZ20250622

Applicant: Stephen Styler

Staff Coordinator: Dustin Wright

Property Owner: B+F TIMPANOGOS TECH CENTER LLC

Parcel ID #: 66:484:0001, 66:484:0002

Acreage: 7.29

Number of Properties: 2

Current zone: Planned Industrial Commercial (PIC)

Proposed Zone: Data Center Overlay (DC)

Council Action Required: Yes

Development Agreement Proffered: Yes

Alternative Actions:

1. **Continue** to a future date to obtain additional information or to further consider the information presented. The next available meeting date is February 25, 2026, at 6:00 p.m.
2. **Recommend denial to the Municipal Council** for the requested Zone Map Amendment. This action would not be consistent with the recommendations of the Staff Report. The Planning Commission should state new findings.

Current Legal Use:

Permitted uses listed in City Code 14.29.020 (Planned Industrial Commercial - PIC Zone). The existing building has been vacant for some time.

Relevant History:

Last year while the city was working on pending legislation for a new data center overlay zone, the applicant applied for the data center project plan. Once the overlay zone ordinance was adopted, they also applied for the new Data Center Overlay Zone (PLRZ20250622) to allow for the proposed data center project to be able to move forward.

Neighborhood Issues:

A neighborhood district meeting was held on December 3, 2025, to hear about the project and rezone. (See attachment #5 for meeting notes)

Summary of Key Issues:

- The property is zoned as Planned Industrial Commercial (PIC). The request is for an overlay zone to allow for a data center.
- The applicant has proffered a development agreement to ensure that power will come from the grid and not be generated onsite, and that the data center will utilize a closed-loop water system for non-consumptive purposes that would not exceed 4,380,000 gallons per year.
- The applicant has shown that they will be able to use power from the grid for the data center instead of generating power onsite.
- The DC overlay zone must only be combined with Light Manufacturing (M1) or Planned Industrial Commercial (PIC) zones. This property is in the PIC zone.

Staff Recommendation:

That the Planning Commission recommend approval to the Municipal Council for a Zone Map Amendment to add the DC overlay zone with a development agreement.

BACKGROUND

The applicant has submitted a project plan along with a rezone request for properties located at approximately 1507 S 180 E to allow for a new data center facility to be built. The property is currently zoned as Planned Industrial Commercial (PIC) and they are requesting to combine it with the Data Center (DC) overlay zone. The DC overlay can only be applied to property in the PIC of Light Manufacturing (M1) zones. This is a new overlay zone, and this is the first property requesting this zone.

Staff have been working with the applicants to address the standards in Planned Industrial Commercial (PIC) zone and the requirements in the proposed Data Center (DC) overlay zone. The original plans for this site were to have a data center with onsite power generation. The opportunity came to acquire power from the city grid instead of generating power onsite and this has been seen as a favorable alternative because it will not create the environmental concerns that came with generating power onsite. The applicant has proffered a development agreement to restrict power for the data center to only come from the grid and that the data center will utilize a closed-loop water system for non-consumptive purposes that would not exceed 4,380,000 gallons per year.

The adjacent property to the east is currently zoned Public Facilities (PF) and the property to the north, south and east, is zoned Planned Industrial Commercial (PIC) and the property to the north west is Regional Shopping Center (SC3).

STAFF ANALYSIS

Sec. 14.020.020(2) establishes criteria for the amendments to the zoning title as follows: **(Staff response in bold type)**

Before recommending an amendment to this Title, the Planning Commission shall determine whether such amendment is in the interest of the public, and is consistent with the goals and policies of the Provo City General Plan. The following guidelines shall be used to determine consistency with the General Plan:

(a) Public purpose for the amendment in question.

Staff response: The amendment would allow for a data center that would not generate onsite power or consume large amounts of water. There is growing need for data centers in the state.

(b) Confirmation that the public purpose is best served by the amendment in question.

Staff response: Power will come from the city grid and water used for cooling will be part of a closed-loop system. They proposed partnerships with local universities for data center technician training and paid apprenticeship programs. They will also hire a local workforce for as many operations and maintenance employment positions as possible.

(c) Compatibility of the proposed amendment with General Plan policies, goals, and objectives.

Staff response: They plan to implement low-impact development (LID) stormwater systems and use native, drought-tolerant landscaping on the property to help support the Conservation and Resiliency Plan and General Plan.

(d) Consistency of the proposed amendment with the General Plan's "timing and sequencing" provisions on changes of use, insofar as they are articulated.

Staff response: They understand that desired power increases will be subject to timing and availability from Provo Power.

(e) Potential of the proposed amendment to hinder or obstruct attainment of the General Plan's articulated policies.

Staff response: This rezone is not anticipated to hinder any policies.

(f) Adverse impacts on adjacent landowners.

Staff response: The data center will have backup generators that will need to be tested periodically and used in the event of a power outage.

(g) Verification of correctness in the original zoning or General Plan for the area in question.

Staff response: The zoning is correct for this site.

(h) In cases where a conflict arises between the General Plan Map and General Plan Policies, precedence shall be given to the Plan Policies.

Staff response: There are no conflicts noted by staff.

Since there will not be power generation onsite, and they will be relying on power from the grid, the impacts to air quality, noise, and vibrations are not what they would be if power was generated onsite. Backup generators will be natural gas which is cleaner than diesel and will only be used for testing and in the event of power loss from the grid. A development agreement has been proffered to ensure that the power generation will not occur onsite and that they will obtain it from the grid.

The other impact to consider is water consumption and waste water. Their plan is to use a closed-loop system. The estimate for this system would be to use between 7,000-12,000 gallons of water per day, including both the water for cooling the servers and for basing domestic needs (like restrooms for staff, *landscaping, etc.*). This would be roughly comparable to that of a carwash or laundromat. Additionally, the water for cooling would be cycled through the system repeatedly rather than evaporating off like some data center cooling systems, which means that over time their real average daily water use is significantly lower than a traditional data center. This closed-looped system has also been proffered as part of the development agreement.

CONCLUSION

Staff recommend approval of the overlay zone with a development agreement that ensures no onsite power generation and a closed-loop water system. With the power coming from the grid and the utilization of a closed loop water system, many of the concerns related to potential environmental impacts are negated.

Proposed Zone change to add a Data Center Overlay to a property in the Planned Industrial Commercial Zone at 1507 South 180 East to develop a data center in the East Bay Neighborhood

Developer Steve Styler presented a proposal for a data center at 1507 South 180 East in the East Bay Neighborhood. The property, owned by B+F Timpanogos, is part of the former Novell campus. Styler explained that earlier this year, they began exploring the idea of developing a small data center campus at the site. As they approached the city, Provo officials decided to take a pause and consider appropriate locations for data centers citywide, ultimately designating certain zones (including PIC and M1) as acceptable for data center overlays. After the city approved this new overlay zoning option, Styler's team submitted their application.

The proposed data center would be 65,000 square feet with a two-story building (130,000 square feet total) on a 9-acre site that currently has a 50,000 square foot building used by a couple of businesses. The property is located near the water treatment facility in a commercial area with no nearby residences.

Key features of the proposed data center:

- It would use closed-loop cooling rather than evaporative/water-intensive cooling systems used in Eastern states. Most of the water consumption will be for the office toilets and sinks.
- The developers are discussing with the Public Works Department the possibility of using recycled water from the nearby treatment plant.
- Power usage would be between 5-50 megawatts, starting smaller (around 5-10 megawatts) and potentially growing to about 30 megawatts of IT load.
- Residents noted that for comparison, Provo City's total power consumption in August/September 2025 was approximately 175 megawatts. Residents also showed concern for rising utility costs because of increased demand versus supply, especially given an expected rise in population and its ensuing demand.
- Backup power would be provided by natural gas generators housed in an L-shaped portion of the building.
- A resident asked about the possibility of installing solar panels and batteries to allow the data center to operate on its own power to alleviate demand during peak power hours – Styler noted that they were open to such a plan but had not made any definite decisions.
- Sound levels at the property edge would be approximately 60-65 decibels, lower than a car passing by.
- The facility would employ approximately 20-30 people.
- The estimated construction cost would be around \$280 million.
- When asked why Provo, Styler replied that it's a great 9-acre property that's surrounded by commercial and wastewater treatment and already has access to certain levels of power.
- A resident asked about repurposing the building if it's no longer used as a data center. Styler responded that it could easily be adapted to other uses.

Styler noted that the data center would provide consistent revenue to Provo Power without the volatility of typical power use patterns, and the building could be repurposed in the future if needed. The developers emphasized their commitment to designing an attractive building with glass ribbon windows on the upper level. They also mentioned potential future educational partnerships with local universities and the opportunity to develop a technology workforce trained in AI.

ITEM 2 Reid Wintersteen requests Project Plan approval for a new 66,000 square foot data center in the PIC (Planned Industrial Commercial) Zone, located at 1507 South 180 East. East Bay Neighborhood. Dustin Wright (801) 852-6414 dwright@provo.gov PLPPA20250210

Applicant: Reid Wintersteen
Staff Coordinator: Dustin Wright
Property Owner: B+F TIMPANOGOS
TECH CENTER LLC
Parcel ID#: 66:484:0001, 66:484:0002
Acreage: 7.29
Number of Properties: 2
Council Action Required: No

Staff Recommendation:

That the Planning Commission **approve** the requested project plan application and parking reduction with the following conditions:

1. Updated plans are submitted, including site and end of project equipment mitigation plans, and are approved by CRC.
2. A final plat is approved and recorded that combines the parcels into one parcel and adjusts the parcel where the charter school is located to not be within 200 feet of the data center property.
3. For the parking reduction to allow 72 parking stalls, a TDM is recorded.

Alternative Actions:

1. **Continue** to a future date to obtain additional information or to further consider the information presented. *The next available meeting date is February 25, 2026, at 6:00 p.m.*
2. **Deny** the requested Project Plan Application. This action would not be consistent with the recommendations of the Staff Report. The Planning Commission should state new findings.

Current Legal Use:

Permitted uses listed in City Code 14.29.020 (Planned Industrial Commercial - PIC Zone)

Relevant History:

Last year while the city was working on pending legislation for a new data center overlay zone, the applicant applied for the data center project plan. Once the overlay zone ordinance was adopted, they also applied for the new Data Center Overlay Zone (PLRZ20250622) to allow for the proposed data center project to be able to move forward.

Neighborhood Issues:

A neighborhood district meeting was held on December 3, 2025, to hear about the project and rezone. (See attachment #5 for meeting notes)

Summary of Key Issues:

- The property is zoned as Planned Industrial Commercial (PIC) and they are also requesting an overlay zone to allow for the proposed use as a data center.
- The project plan needs to conform to the standards in Planned Industrial Commercial (PIC) zone and will also be subject to requirements in the proposed Data Center (DC) overlay zone.
- The proposed use of the property will have a lower parking demand than is required by code for the building size. A Transportation Demand Management program has been provided for parking reduction consideration.
- The applicant has altered the plan so the data center that will use power from the existing grid instead of generating power onsite.

BACKGROUND

The applicant has submitted a project plan along with a rezone request for properties located at approximately 1507 S 180 E. The project plan proposes removal of the existing building and the construction of a new data center facility. The new two-story facility will have a building footprint of 66,000 and a total of 132,000 square feet.

The attached site plan shows another building that was going to be used to house generators for onsite production of power to run the data center. The plans for power have changed since the time this was originally submitted, and they are now going to be acquiring all the power from Provo City. So a building for onsite power generation is no longer needed. The applicant will provide updated plans for staff approval, and this is included in the recommended staff conditions.

The adjacent property to the east is currently zoned Public Facilities (PF) and the property to the north, south and east, is zoned Planned Industrial Commercial (PIC) and the property to the north west is Regional Shopping Center (SC3).

Staff have been working with the applicants to address the standards in Planned Industrial Commercial (PIC) zone and the requirements in the proposed Data Center (DC) overlay zone. Parking requirements are higher than what will be needed for a data center. The applicant has provided a Transportation Demand Management (TDM) program (see attachment 7), and they are asking the Planning Commission for a reduction in parking to be considered.

The proposed overlay zone does not allow data centers to be located within 200' of a property with a school. The property to the south of the proposed data center has a charter school. The property with the school is owned by the same owner as the proposed data center and so they plan to adjust the property lines on that property to be able to meet this requirement. Since the data center will not be producing power onsite with potential environmental impacts and only using backup generators for power outages and periodic testing, this approach seems reasonable.

FINDINGS OF FACT

1. CRC approval is still needed for the project plan.
2. The parking requirement by code is 297 stalls (will be fewer with building square foot reduction in updated plans) and 72 are provided.
3. An approved TDM by the Planning Commission would allow for a parking reduction.
4. Existing parcels would need to be combined into one parcel. An application has already been submitted but still needs CRC approval.
5. PIC zone allows 55' in height and the proposed building height is 55'.

STAFF ANALYSIS

Updated plans showing the removal of the onsite power generation facilities that were initially part of the plan will be needed for staff approval. Onsite parking for the data center will be much less than is required by code. Parking ratios are based on the closest related land use listed in the parking chapter. Since data centers are not listed, warehouse parking ratios would be the

closest and they are one space per 600 square feet. This resulted in a parking requirement of almost 300 parking spaces. The applicant plans to have approximately 30 employees onsite at any given time and so the parking demand is much lower. They have provided a TDM showing their parking need at 71 stalls and they have provided 72. The Planning Commission can approve this type of parking reduction based on finding that this reasonably reflects expected parking demand.

Since there will not be power generation onsite, and they will be relying on power from the grid, the impacts to air quality, noise, and vibrations are not what they would be if power was generated onsite. Backup generators will be natural gas which is cleaner than diesel and will only be used for testing and in the event of power loss from the grid. The backup generators will not provide all the power that would be needed to run the data center, but a small amount to keep things operational until full power is restored. Power usage will be 5-50 megawatts as it becomes available from Provo Power and potentially more in the future, but that would require code changes.

The other impact to consider is water consumption and waste water. Their plan is to use a closed-loop system. The estimate for this system would be to use between 7,000-12,000 gallons of water per day, including both the water for cooling the servers and for basing domestic needs (like restrooms for staff, *landscaping, etc.*). This would be roughly comparable to that of a carwash or laundromat. Additionally, the water for cooling would be cycled through the system repeatedly rather than evaporating off like some data center cooling systems, which means that over time their real average daily water use is significantly lower than a traditional data center.

Noise and vibration information and calculation were provided when onsite power generation was anticipated, and they showed how they would be able to control those to meet city noise ordinance standards. Now that onsite power generation is not happening these will be greatly reduced. The noise ordinance allows up to 75 dBA at property line, both day and night at property line of industrial property. They will be less than 65 dBA at property line (especially without a power plant now). They will use acoustic louvers, generator enclosures, and noise isolation walls to mitigate sound to meet Provo City Code. Their vibration estimates are <0.05 in/s peak particle velocity. Research showed this as a very low, typically negligible level of vibration, well below the threshold for human annoyance or limits for structural damage. For mitigation they will use vibration isolation pads, floating slab design, and structural dampening systems for chillers and rotating equipment

The overlay zone requires an end of project mitigation plan for proper removal of project equipment. They have committed to developing a plan to ensure the responsible disposal of any equipment that may have been utilized by the project to eliminate any negative impact on Provo City and so this has been included in the recommended conditions of approval.

CONCLUSIONS

Staff recommend approval of the project plan with conditions noted in this report. With the power coming from the grid and the utilization of a closed loop water system, many of the

concerns related to potential environmental impacts are negated. A parking reduction is justified with the proposed use and the implementation of the TDM program.

- The facility would employ approximately 20-30 people.
- The estimated construction cost would be around \$280 million.
- When asked why Provo, Styler replied that it's a great 9-acre property that's surrounded by commercial and wastewater treatment and already has access to certain levels of power.
- A resident asked about repurposing the building if it's no longer used as a data center. Styler responded that it could easily be adapted to other uses.

Styler noted that the data center would provide consistent revenue to Provo Power without the volatility of typical power use patterns, and the building could be repurposed in the future if needed. The developers emphasized their commitment to designing an attractive building with glass ribbon windows on the upper level. They also mentioned potential future educational partnerships with local universities and the opportunity to develop a technology workforce trained in AI.

ATTACHMENT 6 –EMISSIONS LETTER

DATE: January 27, 2026

TO: Hannah Salzl

RE: Provo City Development Services

445 W Center ST, Provo, UT

RE: Phase I Development Overview – Proposed B+F Timpanogos Tech Center, LLC Data Center Overlay Zone

To the Provo Planning Commission,

On behalf of B+F Timpanogos Tech Center, LLC (“B+F”), we are submitting this formal outline regarding the initial phase of the proposed data center located at 1507 South 180 East, Provo, UT. The purpose of this letter is to clarify the anticipated utility impact and environmental profile of the facility during its first phase of operation.

Power and Emissions

The current project proposal is designed to be powered exclusively by Provo Power’s municipal electrical grid. Under standard operating conditions, the facility’s emissions profile will be comparable to that of a standard commercial office building. The project will utilize emergency backup generators; however, these will remain inactive except during mandatory annual maintenance testing or in the event of a total loss of city grid power. The total emission producing equipment is anticipated to produce nearly identical volumes of PM 2.5, PM 10, NOx, VOC and CO2e/year as a typical 130,000 square foot office building, which would be produced by the following equipment:

- **Cooling Plant Modules (Chillers): ~ 3-6**
- **CRAH/CRAC / data hall air units: ~ 50-150**
- **Tankless water heaters (gas): ~ 2-8**
- **Emergency generators: ~ 4-10**

Energy efficiency measures are of paramount importance to the applicant. Lighting, HVAC and general office energy efficiencies will be implemented to allow for the maximum amount of power to be delivered to the data center servers and graphic processing units (GPUs). The data center components will be ultra-condensed to maximize the output of the GPUs.

As the current project proposal to be considered by Provo City relies exclusively upon Provo Power's municipal electrical grid, the applicant is not proposing any self-generated renewable power source for the project.

The data center project proposed by B+F is significantly different than many of the data center projects that are frequently portrayed in the media. Contemporary data centers are regularly pursuing hundreds of megawatts, if not gigawatts of energy to power million square foot data hall structures. As electrical utility grids are increasingly strained, hyperscale data centers are pursuing "self-generation" energy projects to provide their own power. B+F's proposal is to rely on Provo City's municipal electrical grid where existing electricity can be readily supplied. Thus, by comparison, B+F's project represents a mere fraction of the energy consumption being demanded by contemporary hyperscale facilities across the state.

While B+F, has engaged with Provo Power and UMPA to identify additional energy generation opportunities, any future energy project would be presented to Provo City in a separate and distinct application from the current application. Should B+F propose a separate and distinct proposal for a joint energy project with Provo Power and UMPA in the future, a full environmental analysis of said project including air emissions, water consumption, waste water impact, and all other items required by Provo City Code 14.34A.050 will be provided to Provo City for their full review and approval. However, this application does not include or authorize any on-site power generation, nor propose the approval of any environmental impacts that might be created thereby.

Water Consumption and Wastewater Impact

The projected water usage for Phase I is consistent with the demands of a typical office building of similar scale. The data center will utilize a closed-loop cooling system. We currently anticipate a daily consumption rate of approximately 7,000 to 12,000 gallons per day. This usage supports both the facility's cooling requirements and domestic needs. The anticipated design of the data center will have little to no impact on the Provo City wastewater system as the closed-loop cooling system does not require cycling. Wastewater impacts would be limited to comparable wastewater discharge to a similar sized commercial office building.

Fortunately, data center campuses across the western United States no longer construct evaporative cooling systems due to the introduction of closed-loop cooling systems. Due to the size differential between B+F's project and these other hyper-scale facilities, the proposed water use and wastewater impact by B+F will be a mere fraction of the water and wastewater demand from a hyper-scale data center project.

End of Project Mitigation

B+F's proposed project is intended to operate for the foreseeable future. However, as part of Provo City's future permitting of said project, B+F fully anticipates to present an end-of project equipment removal plan for Provo City's approval. B+F will develop a plan to ensure the responsible disposal of any equipment that may have been utilized by the project to eliminate any negative impact to Provo City.

Scope of Current Documentation

At this preliminary stage of the approval process, the figures provided represent our best professional estimates based on the current architectural program. Providing further granular detail or technical specificity would require the commission of exhaustive engineering reports and finalized MEP (Mechanical, Electrical, and Plumbing) designs. Given the current phase of the entitlement process, such additional studies are not yet practical; however, comprehensive reports will be provided as the project progresses into the formal permitting and construction document phases.

We look forward to working with the City to ensure this project remains a sustainable and beneficial addition to the city of Provo.

Transportation Demand Management (TDM)

for the

B+F Timpanogos Tech Center (Ferrado)

Written by

Robert A. Arrington, RA - AIA

Revised 01/27/2026

Comprehensive Transportation Demand Management (TDM) Program Plan

1. Executive Summary

This Transportation Demand Management (TDM) Program Plan outlines a strategic approach to influence travel behavior, reduce single-occupancy vehicle (SOV) trips, alleviate traffic congestion, improve air quality, and promote sustainable transportation options. By implementing a combination of incentives, infrastructure improvements, and educational initiatives, this program aims to foster a more efficient, accessible, and environmentally friendly transportation system.

2. Goals and Objectives

The primary goal of this TDM program is to reduce reliance on single-occupancy vehicles and encourage the use of alternative, sustainable transportation modes. Specific objectives include:

- **Reduce SOV Commute Rate:** Achieve a reduction in the percentage of employees commuting by SOV.
- **Increase Alternative Mode Share:** Increase the combined share of transit, carpool/vanpool, cycling, and walking trips.
- **Reduce Vehicle Miles Traveled (VMT):** Contribute to a reduction in VMT associated with employee commute trips.
- **Enhance Accessibility:** Improve access to the site/area via multiple transportation modes.
- **Support Environmental Sustainability:** Reduce greenhouse gas emissions and improve local air quality.
- **Optimize Parking Utilization:** Efficiently manage existing parking resources and potentially reduce the need for new parking infrastructure.

3. Target Audience

This TDM program is designed to serve:

- **Employees:** All full-time and part-time staff working at TTC-Prove Data Center

4. TDM Strategies and Measures

This program will implement a multi-faceted approach, combining various strategies categorized as follows:

4.1. Parking Management Strategies

- **Preferred Parking:** Designate 2% prime parking spots for carpoolers, vanpoolers, and electric vehicles.
- **Reduced Parking Maximums:** Advocate for or utilize reduced parking maximums in new developments, as permitted by local zoning codes (e.g., Provo City Code 14.37.050).
- **Shared Parking:** Implement shared parking agreements with adjacent businesses or facilities during off-peak hours. TTC-Data Center also owns the Office complex just south, with lots of parking. They are open to shared agreement with others in the community to help reduce the need for new parking. This includes the city water treatment plan just east of the project.

4.2. Public Transit Incentives

- **Subsidized Transit Passes:** Provided UTA passes to all employees upon their request.
- **First/Last Mile Solutions:** Note, there are 3 bus stops at the northwest intersection of the project site

4.3. Bicycle and Pedestrian Facilities

- **Secure Bicycle Parking:** Provide ample, secure, and conveniently located bicycle racks and lockers (both short-term and long-term). Approximately 10%
- **End-of-Trip Facilities:** Install showers, changing rooms, and lockers for cyclists and walkers.
- **Pedestrian Infrastructure Improvements:** We are improving sidewalks, crosswalks, lighting, and pedestrian-friendly pathways leading to the site.

4.4. Carpool and Vanpool Programs

- **Vanpool Formation Assistance:** Assist employees in forming new vanpools.
- **Carpool/Vanpool Incentives:** Implement reward programs or raffles for active carpool/vanpool participants.

4.5. Flexible Work Arrangements

- **Telecommuting/Remote Work:** Encourage and support telecommuting policies where feasible, reducing daily commute trips.
- **Flexible Work Hours:** Allow employees to adjust their start and end times to avoid peak congestion periods where feasible.

4.6. Marketing, Outreach, and Education

- **Commute Challenges:** Organize friendly competitions to encourage mode shift and participation.

4.7. Technology Solutions

- **Electric Vehicle (EV) Charging Stations:** Install EV charging infrastructure to support the shift to cleaner vehicles.

5. Monitoring and Evaluation

Regular monitoring and evaluation are crucial to assess the program's effectiveness and make necessary adjustments.

5.1. Key Performance Indicators (KPIs)

- **SOV Commute Rate:** Percentage of employees/residents driving alone.
- **Mode Split:** Percentage breakdown of travel modes (transit, carpool, bike, walk, telecommute).
- **Vehicle Miles Traveled (VMT) Reduction:** Estimated VMT reduction based on mode shift.
- **Parking Utilization Rates:** Occupancy levels of parking facilities.
- **Program Participation Rates:** Number of individuals utilizing TDM incentives/facilities.
- **User Satisfaction:** Feedback from employees/residents on TDM program effectiveness and convenience.

5.2. Data Collection Methods

- **Annual Commute Surveys:** Administer comprehensive surveys to employees/residents to gather mode split data, travel patterns, and feedback.
- **Parking Counts:** Regular manual or automated counts of parking spaces to assess utilization.

5.3. Reporting Frequency

- **Annual Reports:** Submit reports to relevant city departments (e.g., Provo City Planning Commission for TDM agreement compliance) detailing program performance against objectives per the city's directives.

5.4. Adaptive Management

The TDM program will be reviewed and adapted based on monitoring results, user feedback, and changing transportation needs or technologies. Strategies that are not performing as expected will be re-evaluated and modified.

6. Legal and Regulatory Compliance

This TDM program will be developed and implemented in full compliance with all applicable local, state, and federal regulations, including specific requirements outlined in the Provo City Code, Chapter 14.37.050 regarding TDM programs and parking reductions.

7. Conclusion

This Comprehensive TDM Program Plan represents a commitment to fostering sustainable transportation, reducing environmental impact, and enhancing the quality of life. By actively promoting and supporting alternative modes of transportation, we aim to create a more efficient, accessible, and vibrant environment for everyone.
